Great British Mollusca Types Project: A Union Database for the U.K.

Ben Rowson¹, Harriet Wood¹, Jon Ablett², Jennifer Gallichan¹, Andreia Salvador², James Turner¹, Anna Holmes¹, Graham Oliver¹

¹ Department of Natural Sciences, Amgueddfa Cymru – National Museum Wales, Cathays Park, Cardiff, CF10 3NP; ² Department of Life Sciences, Natural History Museum, Cromwell Road, London, SW7 5BD

Participating staff from partner museums: Richard Sutcliffe (Glasgow Museums); Maggie Reilly (Glasgow Hunterian); Tony Hunter (Liverpool); Dan Gordon (Newcastle); Rebecca Machin & Clare Brown (Leeds); Rachel Petts (Manchester); Holly Morgenroth (Exeter)

THE PROJECT

Amgueddfa Cymru - National Museum Wales (AC-NMW) and The Natural History Museum (NHMUK) are developing a universally accessible database connecting the Mollusca type collections of nine museums for the first time. Funded by the John Ellerman Foundation (Regional Museums & Galleries Fund), staff at seven partner museums in six UK cities, each lacking a malacological curator, are being trained to recognise, research and interpret molluscan type specimens in their collections.

WHAT IS A TYPE?

Nomenclatural "types" in natural history collections are the original specimens used to describe species. Types are required and sought out by researchers, but many curators today are insufficiently specialised, or lack resources, to attend to their research and curation. Such types risk being 'lost' to an international scientific community unaware of their location.

Part of the collections examined during the visit to Manchester Museum, February 2017. If only types were always to be found in labelled drawers!

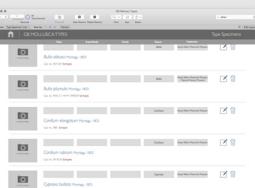

AC-NMW Mollusca types database

DIGITISATION & ONLINE PRODUCT

In 2012, AC-NMW made over 400 of their Mollusca types available on a new online database. The database has been accessed by over 4000 people from 113 countries. This access has stimulated the use of these types in research projects. Enquiries have increased dramatically, with specimens being cited in dozens of primary publications, in studies of molluscs from all continents as well as those that are part of Britain's own wildlife. As a result, AC-NMW staff have learnt more about their holdings from visitors to the site and attracted new depositions.

AC-NMW's resource will be used as the model for the new database. Once all of the research is complete, all of the findings, complete with specialist photographs and key details, will be made available on the database, each specimen clearly linked back to its holding institution.

Blog post on the AC-NMW mollusca type collections

THE RESULT

For the first time, data from these 9 institutions will be recorded permanently on an internationally accessible online database, with potential for future expansion as other UK museums add their Mollusca types. Curatorial skills will be developed at regional museums, which are transferable to other natural history collections. Relationships between the museums will be strengthened and enhanced for the potential benefit of all participants and their audiences. Collections will be much more accessible, highlighting the global significance of UK national and regional museum collections.

DISSEMINATION

The project will conclude with a workshop at NHMUK, reuniting participants to share our results and experiences. This will also be open to other interested parties, including the public, members of Britain's three malacological societies, and potential future partners. For wider dissemination, we plan to run talks, attend conferences, and encourage the publication of papers.

Examining the collections at Manchester Museum, February 2017

THE PARTNER MUSEUMS

The participating museums (see map) were all known to have significant collections of mollusc types in varying stages of curation and research, but all lacked specialist malacology curators. Few of their types were traceable online or in print, and fewer still had been photographed. There was no platform available to bring this historically and scientifically important information together across Great Britain.

TRAINING

A key part of this project is capacity building and sharing skills amongst the partner museums. To kickstart the project, we ran a group workshop covering how to research types and work with mollusc collections.

Participants at the training workshop at AC-NMW, Cardiff, June 2016

Examining the collections at the Great North Museum: Hancock, October 2016

JOINT RESEARCH

From October 2016, we began the process of visiting the collections at each of the partner museums. We worked with the curators to locate known and potential types. These specimens were loaned to AC-NMW or NHMUK for specialist photography, databasing, and further taxonomic research. Where needed we also carried out minor curation or conservation.

WHO WILL BENEFIT?

This project has broader benefits not just for specialists, but also for the wider public audience. Natural history type specimens have the potential to spark the imagination. Many have social history, cultural, and aesthetic dimensions as well as their scientific ones. Making links between objects can help enrich local and national culture and encourage participation and debate. As well as their main use for globally important scientific study, the high-quality images and other products of research will be suitable for use in many contexts - exhibitions, social media, events, merchandise and publications.

LATEST NEWS

- June 2016: We held a two-day uniquely specialised training workshop at AC-NMW covering many aspects of types and malacology. Staff from six partner Museums travelled to take part.

"...reminds me why I got into museums..."
"...best workshop I've ever been to..."
"...makes me feel like a curator again..."

- October 2016: We worked on finding and identifying type material in the Angus, and Alder & Hancock collections at the Great North Museum, Newcastle. Most of the fluid types need basic remedial conservation, which will be carried out whilst on loan to NHMUK.
